

AUSTRALIAN ENERGY EFFICIENT BUILDING CONSULTANTS

Company Profile

Since starting off as part of the CADDs group in 1994, Australian Energy Efficient Building Consultants has always been a modest company achieving remarkable outcomes in the sustainable building industry. We have developed a strong reputation for being able to provide sustainability consulting and energy efficiency assessments on any type of building anywhere in Australia.

AEEBC strives to offer the best possible consulting and assessment service, ensuring client satisfaction in many areas including:

- House Energy Rating Software Assessments
- Deemed to Satisfy Assessments
- Energy and Water Audits
- Advanced Thermal Modeling
- Sustainable Building Consulting.

Our building design division CADDs Architectural can produce high quality design and documentation for any size and style of project. Any of these services can be offered at any stage of the building design and development, from concept creation through to refurbishment and additions.

Our young and vibrant team of consultants has constantly pushed the envelope of energy efficient design and counsel, diversifying to keep pace with the exponential growth in new technologies and continuously changing client needs. Coming from a number of different disciplines such as environmental science, building thermal performance and building design, AEEBC's nationally accredited staff has over a decade of experience, a unique achievement in such a recently established industry.

We provide a highly cost effective and efficient Energy Assessment Service for both residential and commercial buildings which we believe accompany the best rates and fastest turnaround times in Australia. We use all the current available assessment tools including FirstRate, AccuRate, BERS PRO PRO, DTS (Deemed to Satisfy) and BASIX assessments. On review of a project we select the appropriate method of assessment and geographical location.

AEEBC not only assesses new projects, we also offer house energy rating software assessments on existing homes. Home owners are quickly discovering that energy assessments, (mandatory in some parts of Australia) can increase the value of their home significantly, as well improve comfort of the home and reduce carbon footprint. With energy costs increasing and more and more government rebates becoming available, an energy assessment for an existing home has never been more invaluable. Energy and Water Audits can be performed on AEEBC for commercial and residential buildings. We can investigate annual water and energy usage and make recommendations for achieving dramatic savings. Past projects have seen us perform energy audits on a variety of building types such as warehouses and sporting pavilions.

With a large number of services available within the one company, our clients have the unique ability to choose what level of sustainability their project will achieve whether it is minimum BCA compliance or they can work closely with our consultants to redefine their own terms of energy and water efficient design.
